DETAILED ACTION

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 1-14 are rejected under 35 USC §102(b)/103(a) in view of Levit, US Patent Application Publication No. or Ramachandran et al., US Patent No. 5,833,807. This rejection is set forth in the prior Office action mailed on June 22, 2007.

The rejection based on Ootuka et al. and Kurumatani et al. has been withdrawn in view of applicants' arguments.

Response to Arguments

3. Applicant's arguments filed on September 24, 2007 have been fully considered but they are not persuasive.

Applicants argue that Levit does not teach the combination of pulp and floc as claimed, since he only teaches floc. Also, applicants argue that Ramachandran et al. do not teach the ratio of pulp and floc as claimed, or the initial modulus of the floc, as it also claimed.

The arguments are not convincing for the following reasons:

- With respect to Levit, while the examiner recognizes that Levit teaches only floc, he teaches also that it is common in the art to use pulp fibers and floc to make

papers, such as in US Patent No. 4,698,267, which teaches para-aramid pulp in combination with para/meta-aramid floc, see ¶-[005]. Further reviewing the disclosed patent, 4,698,267, it teaches the same claimed % of pulp and floc, see for example tables I through IV and teaches same range of initial modulus in the floc, see column 2, lines 59-68 where they teach that the modules for the floc are between 20.3 dN/tex to 840 dN/tex, (203 cN/tex to 8400 cN/tex).

As to Ramachandran et al. while not explicitly disclosing the ratio of fibers, they teach that the sheet contains between 5-95 of aramid fibers which includes at least one of aramid fibers or aramid floc, see column 4, lines 3-10. In the same lines they teach that the amount of fibers is selected to be convenient and to afford optimized dispersion and dispersion qualities. The latter clearly indicates that the proportion of fibers to floc can be optimized to desired requirements. It has been held that "[T]he discovery of an optimum value of a result effective variable in a known process is ordinarily within the skill of the art. *In re Antoine*, 559 F.2d 618, 195 USPQ 6 (CCPA 1977); *In re Aller*, 42 CCPA 824, 220 F.2d 454, 105 USPQ 233 (1995).

- As to the initial modulus, this is inherent to Ramachandran et al. invention since they use the same trademarks as the ones disclosed in the specification, i.e.
